

Statistics

As of 2018/01/03, the database contains

- 383 records of a supernova remnant (SNR): the 295 objects of Green's catalogue as of June 2017, plus 99 objects confirmed or candidates [see list at the end]: several filled-centre remnants, and also shells or composites that were added in the light of recent observations. 128 records mention a neutron star (NS) or NS candidate, 109 being identified as a pulsar (PSR), including 6 anomalous X-ray pulsars (AXPs). There are also 5 soft gamma-ray repeaters (SGRs), and a total of 13 magnetar candidates. The list also includes 15 central compact objects (CCOs) or CCO candidates. A pulsar wind nebula (PWN) is detected or suggested in 106 cases (which are not a subset of the population of SNRs having a NS: only 84 SNRs are associated with both a PWN and a NS/PSR. Interaction of the shell with a molecular cloud is reported in 73 cases, with varying levels of confidence.
- 14 records of the sighting of a supernova, that are referred to by 14 SNRs records (in a non-bijective way, and with varying levels of confidence).
- 1674 records of high-energy observations made with 41 observatories, as shown in Table 1. Note that 425 of these are actually non-detections, and that the emission might not be coming from the SNR, as seen in Table 2.
- 2352 references in the form of SAO/NASA ADS bibcodes, plus hundreds of other URLs.
